

A food concierge that remembers how you eat

Conversational food recommendations powered by your own history — allergies, taste, habits.

Claude Agent SDK (Python) · Tencent EdgeOne Makers

github.com/arnabmaiti-gif/food-recommender

The problem

- Choosing where to eat is a **repeated decision made with zero memory**
- Every app asks the same questions and shows the same crowd-ranked lists
- The strongest signal is the least used: **your own record** —
what you chose, what you said afterwards, what you're allergic to

| A 4.6★ bakery is the wrong answer if **you** rated it 2★ — "frosting way too sweet."

The core loop

1. **You ask** — "I'm craving dessert"
2. **Hard filters first** — peanut allergy is non-negotiable, item-level
3. **Pattern mining** — low-sugar habit? rating floor? quiet café or lively bar? solo-work or social? dine-in or pickup?
4. **Your feedback beats crowd ratings** — quoted back to you as evidence
5. **2–3 options**, each with a **why** traced to real data
6. **Not satisfied?** It asks 2–3 questions — **pre-filled with the answers your history predicts** — then re-ranks
7. **Your choice is remembered** for next time

What a recommendation looks like

Amber & Rye Patisserie — small café · 4.7★ · 8 min · \$\$

Why: low-sugar picks in **5 of your 6** dessert runs, and your own 5★ review: "nobody rushed me for two hours."

Matcha-ya Tea House — tiny tea house · 4.8★ · 12 min · \$\$

Why: your dessert runs are usually **solo work sessions** — this is the calmest room in the city.

⊖ Skipped **Sugar Rush Bakehouse** (4.6★ crowd) — you rated it 2★: "frosting way too sweet."

Context flips it: "a friend is visiting, we want something fun" →

Molten Dessert Bar rises — with a warning to skip the peanut praline flight.

Architecture

React + Vite chat (SSE stream, tool lamps, trace panel)

| POST /chat

EdgeOne Makers agent function (Python, Claude Agent SDK)

| Skill + Read (scoped to .claude/skills/**)

food-concierge skill = the entire "brain"

└ SKILL.md recommendation method

└ profile.json allergies, preset rules

└ restaurants.json 12-place catalog

└ order_history.json 12 past sessions + context

└ feedback.json 9 post-visit reviews

| files tool (sandbox)

taste-memory.json ← chosen options written back

The logic is **data**, not code

- **SKILL.md** holds the method; **JSON files** hold the user's world; the system prompt holds the guardrails
- Zero hardcoded scoring rules in the app — change the user by changing the data
- Synthetic persona crafted so patterns **pop** in a demo:
peanut allergy · low-sugar habit · quiet laptop-friendly cafés ·
one social exception · a 2★ grudge
- **Watch it think**: the trace panel shows the skill load and every data-file read, live

Built on the EdgeOne Makers stack

From the template	Added for TasteBud
SSE streaming chat loop	Concierge system prompt (PRD flow)
Sandbox tools via MCP	<code>food-concierge</code> skill + synthetic dataset
Conversation persistence	Choice write-back (<code>taste-memory.json</code>)
React chat UI	Rebrand: palette, type, preset chips, en/中文 copy

- Model-agnostic: free built-in `@makers/deepseek-v4-flash`, or BYOK (Anthropic API)
- One-click deploy to EdgeOne Makers

Try it in 5 minutes

- **Demo:** follow `DEMO_SCRIPT.md` — happy path → refinement → choice memory → allergy handling at lunch
- **Run it:** `npm install` · `pip install -r agents/requirements.txt` ·
set `AI_GATEWAY_API_KEY` · `edgeone makers dev`
- **Spec:** `docs/PRD.md`

Roadmap

Real accounts → live restaurant data → structured option cards →
full learning loop into canonical history
